Privacy, Consent, and Data Security

BY THE END:

You can explain privacy, consent, and simple ways to protect personal data.

Overview

Personal data can include a person’s name, phone number, location, payments, or health information. This information needs careful protection.

Privacy and Consent

Privacy is a person's right to control their personal information.

Consent means that a person understands how their data will be used and agrees to that use.

Collect Only What Is Needed

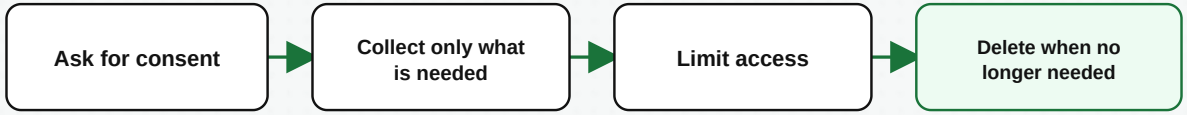

Data minimization means collecting only the data needed for a clear purpose.

For example, a mobile-money company may need a customer's monthly account total to assess a loan. It does not need the name of every person the customer paid.

Collecting less data reduces what could be exposed or misused.

Protect Data at Every Stage

Data security means protecting data from unauthorized access, loss, theft, or hacking.

A privacy policy is not enough by itself. The organization must also control the data in practice.

Simple security checks:

- How many copies of the data exist?
- Who can open each copy?
- Is access recorded?
- When will the data be deleted?
